

DR300

Pressure regulator

Product specification sheet

Construction

The pressure regulator comprises:

- Housing with flanges to ISO 7005
- Pilot valve CX-PR with integral fine regulation valve
- Control circuit with ball valves on inlet and outlet
- Control circuit with integral rinsable filter insert

Materials

- Ductile iron housing, cover plate and diaphragm plate (ISO 1083), powder coated
- Red bronze/stainless steel regulating cone
- Stainless steel pressure spring and control rod
- Fibre-reinforced NBR diaphragm
- NBR and EPDM seals
- Stainless steel valve seat
- High quality synthetic material control circuits
- Brass compression fittings
- Brass pilot valve housing
- Stainless steel filter insert

Application

Pressure regulators of this type protect downstream installations against excessive supply pressure.

Pressure regulators are used when the capacity of direct controlled pressure reducing valves are insufficient. Their compact construction makes them particularly suitable for installation in limited spaces, for example in ducts.

By using a pressure regulator, pressurization damage is avoided and water consumption reduced.

The set pressure is also maintained constant, even when there is wide inlet pressure fluctuation.

Reduction of the operating pressure and maintaining it at a constant level minimizes flow noise in the installation.

Special Features

- High flow capacity
- Light weight
- High control accuracy
- Outlet pressure up to 12.0 bar
- Powder coated inside and outside - Powder used is physiologically and toxicologically safe
- Integral control circuit and ball valves
- No external energy required for operation
- Replaceable valve seat

Range of Application

Medium	Water
Inlet pressure	max. 16 bar
Outlet pressure	1-12 bar

Technical Data

Operating temperature	max. 80°C
Nominal pressure	PN 16 PN 25 on request
Minimum pressure	0.7 bar
Minimum pressure drop	1 bar
Nominal size	DN 50 - DN 450

Method of Operation

At zero pressure the valve is closed. When the system is then put into operation, the water flows in and opens the diaphragm valve. The outlet pressure is diverted via the link pipework to the pilot valve, which then closes. If the pilot valve is closed, the pressure in the chamber above the mem-brane rises. The membrane sur-face area is larger than the valve surface area and therefore the diaphragm valve closes. When water is drawn from the outlet, the outlet pressure falls, which in turn causes the pilot valve to open. As soon as the opening of the pilot valve becomes greater than the cross sectional area of the opening in the fine regulation valve, the pressure in the chamber above the diaphragm falls and the inlet pressure opens the diaphragm valve.

In this way the pilot valve regulates the control pressure so that the diaphragm valve opens just the required amount needed to maintain the outlet at constant pressure.

Options

DR300-... A = Flange PN 16, ISO 7005-2, EN 1092-2

DR300-... B = Flange PN 25, ISO 7005-2, EN 1092-2

Accessories

RV283P Check valve

Grey cast iron housing, powder coated inside and outside. DIN/DVGW tested in compulsory test sizes DN 65, DN 80 and DN 100

FY69P Strainer

With double mesh, grey cast iron housing, powder coated inside and outside.

A = Mesh size approximately 0.5 mm

F76S-F Reverse-rinsing filter

Red bronze housing and filter bowl. Available in sizes DN 65 to DN 100, with filter mesh sizes 100 µm or 200 µm

Installation Example

Installation Guidelines

- Shut off valves should be fitted on each side of the pressure regulator
- Fit strainer upstream of pressure regulator
 - Protects against damage from coarse dirt
- Note flow direction (indicated by arrow)
- The installation location should be protected against frost and be easily accessible
 - Simplifies maintenance and inspection
- It is recommended that a straight section of pipework of at least five times the nominal valve size is provided after the pressure reducing valve
- Fit connectors for removal and refitting for maintenance
- Safety valve SV300 optional

Typical Applications

Pressure regulators of this type, within the limits of their specifications, are suitable for installation in water supply systems, in residential buildings and in industrial installations.

- Potable water supply
- Swimming pools
- Firefighting systems - sprinkler installations
- Ship construction (fire tenders)
- Watering systems in market gardens and in agriculture
- Water supply networks in large building developments (eg. high rise blocks)
- Hydrant systems at airports and dockyards
- Mining applications
- Gravel pits, concrete mixing plants etc.
